

SOAR Incident Containment Engine

Invalid Input Testing Report

Objective

To verify that the API correctly validates user input and rejects invalid requests with appropriate error responses.

Test Case 1: Empty Request Body

Endpoint: POST /alerts

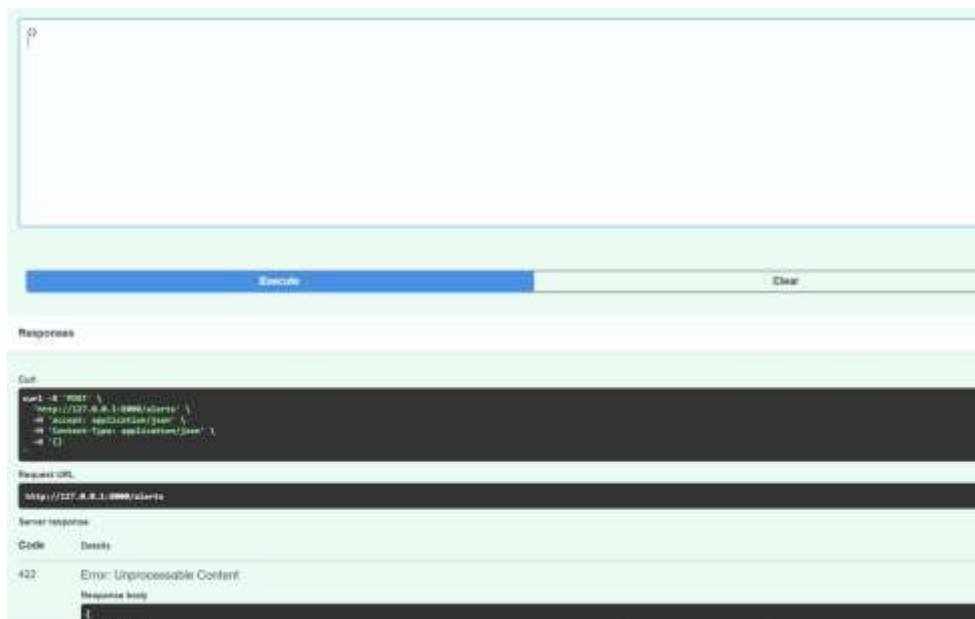

Test Input: {}

Expected Result: API should reject the request and return a validation error.

Actual Result: API returned 422 Unprocessable Content indicating missing required fields.

Status: PASS

Evidence:

The screenshot displays a REST client interface. At the top, there is a large text area for the request body, which is currently empty. Below this, there are buttons for 'Encode' and 'Clear'. The 'Responses' section is expanded, showing the raw response body in a dark-themed editor. The response is a JSON object: {"error": "Unprocessable Content", "message": "Missing required fields: name, severity, containment_type"}. Below the response body, the 'Request URL' is shown as 'http://127.0.0.1:8080/alerts'. The 'Server response' section is also expanded, showing a table with the status code '422' and the message 'Error: Unprocessable Content'. The 'Response body' is shown as a JSON object: {"error": "Unprocessable Content", "message": "Missing required fields: name, severity, containment_type"}. The 'Response headers' section is also expanded, showing a table with the status code '422' and the message 'Error: Unprocessable Content'.

Test Case 2: Missing Required Fields

Endpoint: POST /alerts

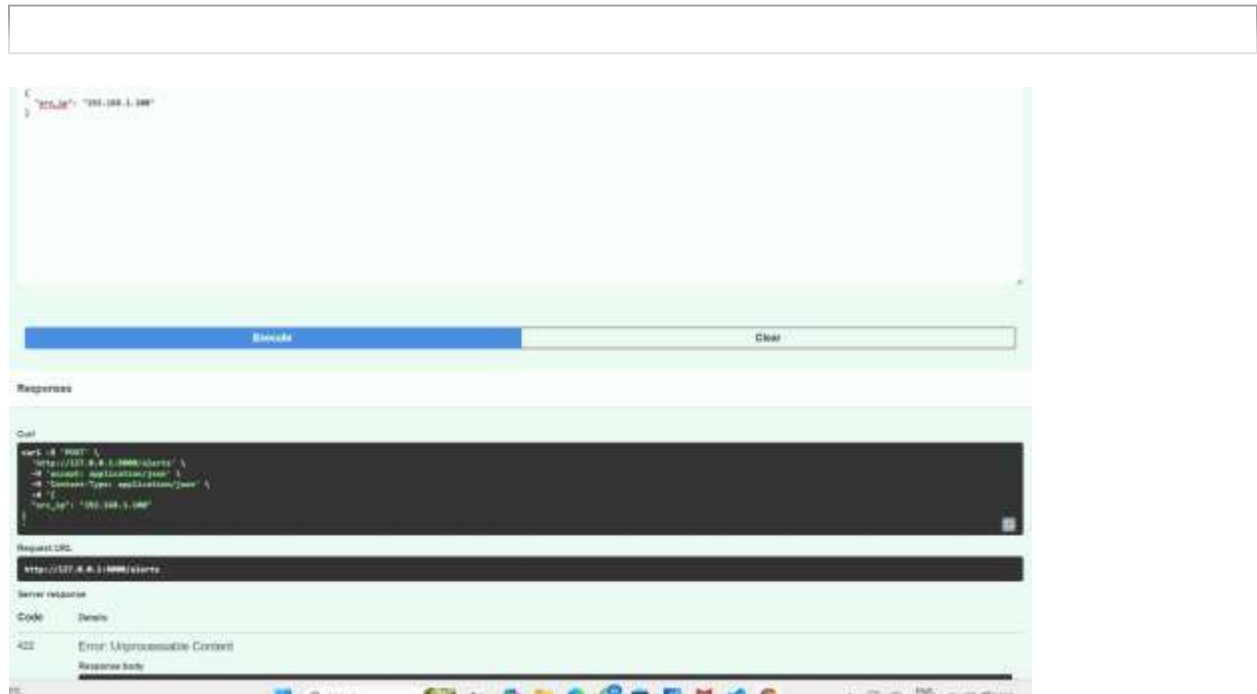

Test Input: { "src_ip": "192.168.1.100" }

Expected Result: API should reject the request and identify missing required fields.

Actual Result: API returned 422 Unprocessable Content with validation error.

Status: PASS

Evidence:

Test Case 3: Invalid Severity Value

Endpoint: POST /alerts

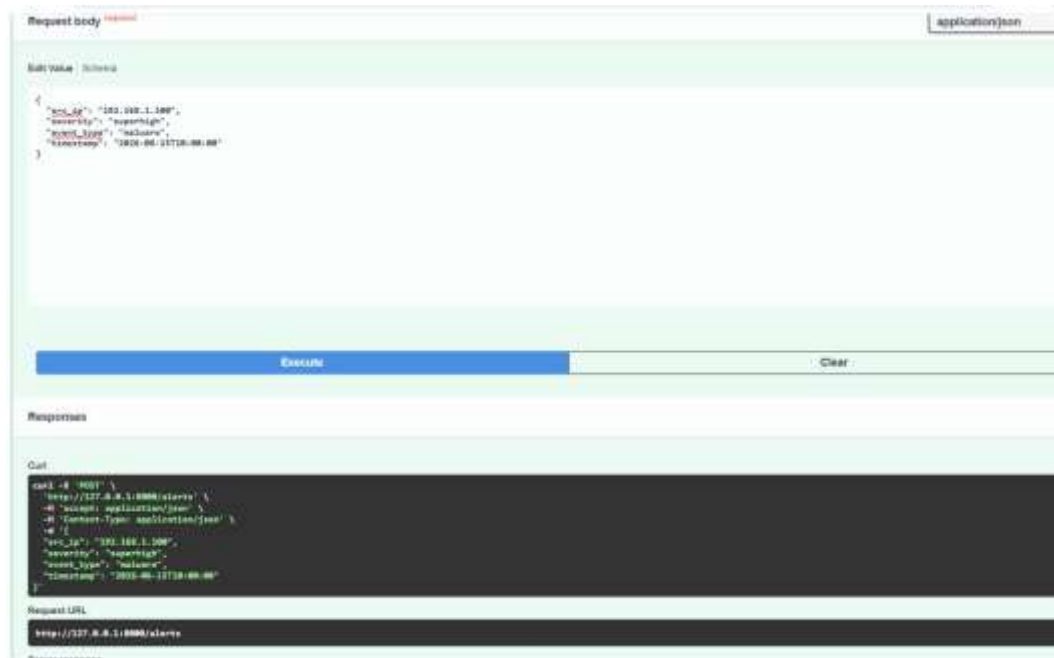

Test Input: { "src_ip": "192.168.1.100", "severity": "superhigh", "event_type": "malware", "timestamp": "2026-06-15T10:00:00" }

Expected Result: API should reject invalid severity values and return a validation error.

Actual Result: API returned 422 Unprocessable Content and rejected the invalid severity value.

Status: PASS

Evidence:

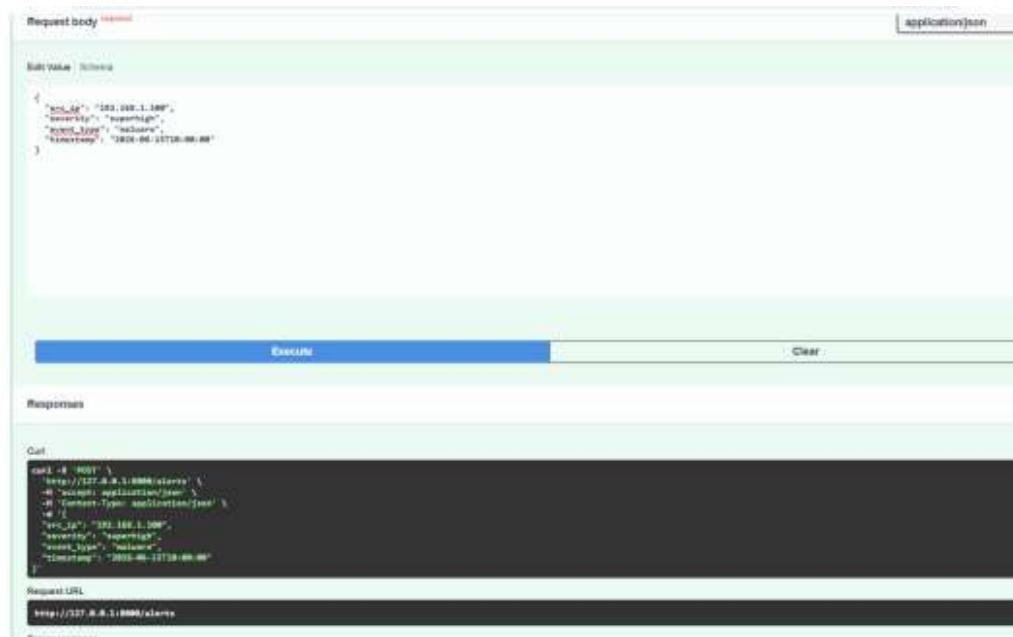

Test Case 4: Invalid Incident ID

Expected Result: API should return an appropriate error message such as "Incident Not Found".

Actual Result: API returned an error response for the invalid incident ID.

Status: PASS

Evidence: Screenshot showing invalid incident ID test result.

Conclusion

All invalid input validation test cases were executed successfully. The API correctly rejected invalid requests and returned appropriate validation errors (422 Unprocessable Content). No unexpected behavior or security issues were observed during testing. Therefore, the Invalid Input Testing phase is considered PASSED.
